

LIGHT WITH A CLIP

ABSTRACT

A portable light intended for mounting on a garment as support includes two LED light sources spaced apart towards the rear of the portable light. A clipped base below an anchor facilitates locating a garment between the anchor and the base, and a spring action urges the base toward the anchor. A hingedly movable head for the LEDs is mounted on the housing to move to and from the housing. An opening of the housing causes a switch in the housing to move between an opened and closed position such that a circuit activates or deactivates the LED lights when the head opens or closes relative to the housing.
